

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

of the mean rate of interest between the limits is a fair one when loans and repayments are dealt with year by year, the table in the Paper continues the series and indicates how such an assumption should be modified to represent the average accumulations of longer transactions. A real and not a fictitious tabular simplicity of results may thus, it is hoped, be gradually brought about in actuarial calculations; and with the greater and greater effect, as the supposed difficulties of variation, instead of being evaded, become more and more thoroughly studied.

To prevent undue inferences, it is right to state that the eminent mathematician alluded to, is not to be considered as in any way answerable for the contents of the paper in question, nor indeed as an implied authority either for or against the principles therein enunciated.

Your obedient Servant,

EDWIN JAS. FARREN.

*Hanover Chambers, Buckingham Street, Strand,  
London, February 2nd, 1855.*

#### ON THE FACILITIES AFFORDED BY MR. THOMSON'S ACTUARIAL TABLES IN MAKING CERTAIN CALCULATIONS.

*To the Editor of the Assurance Magazine.*

SIR,—It would, I think, be useful, if you were to invite communications from your readers of such questions as they may meet with in practice, and which are not to be found in the text books. If you approve of this suggestion, and think the accompanying case worthy of a place in your *Magazine*, perhaps you will kindly insert it. The facility with which the formula is worked out affords another instance of the usefulness of Mr. Thomson's Actuarial Tables, and of the consequent benefit they confer on the profession.

I am, Sir, yours truly,

ROBERT TUCKER.

*Lombard Street, 8th February, 1855.*

What single and annual premium should be charged to secure £100 per annum to A, aged 32, after the death of B, aged 40, provided B die within 5 years (Carlisle 3 per cent.)?

The value of that portion of the annuity which may be enjoyed by A during the first five years is evidently  ${}_{\overline{5}|}A - {}_{\overline{5}|}AB$ ; and it is equally clear, that the value of the remaining portion is  ${}^5A \times {}_{\overline{5}|}\mathfrak{B}$   $\therefore$  the total value of the annuity is  ${}_{\overline{5}|}A - {}_{\overline{5}|}AB + {}^5A \times {}_{\overline{5}|}\mathfrak{B}$ .

Thomson, Table 1, Single Lives.

$A = 19.13521$	$*AB = 14.30229$
$A - {}_{\overline{5} }A = 14.69049$	${}_{\overline{5} }AB = 9.91515$
${}_{\overline{5} }A = \begin{array}{r} 4.44472 \\ 4.38714 \end{array}$	${}_{\overline{5} }AB = \begin{array}{r} 4.38714 \end{array}$

$${}_{\overline{5}|}A - {}_{\overline{5}|}AB = 0.05758$$

Table 2, Single Deaths.

$\mathfrak{B} = 4.7158$
${}_{\overline{5} }\mathfrak{B} = 4.0884$
${}_{\overline{5} }\mathfrak{B} = .06274$

\* AB being taken equal to a single life of 50.

$${}^5A \times {}_{\overline{5}|}33 = 17.9287 \times .06274 = 1.124846$$

$$.05758$$

$${}_{\overline{5}|}A - {}_{\overline{5}|}AB + {}^5A \times {}_{\overline{5}|}33 = 1.182426$$

$$\text{Annual premium} = \frac{1.182426}{1 + {}_{\overline{4}|}AB} = \frac{1.182426}{4.588} = .25772 \text{ for } \text{£}100 \text{ per}$$

annum. Premium in one sum, £118. 4s. 10d., or £25. 15s. 5d. annually.

#### FORMULA FOR AN APPROXIMATE VALUE OF ANNUITIES AT SIMPLE INTEREST.

*To the Editor of the Assurance Magazine.*

SIR,—In looking over some old letters, I found one, dated some years back, from Professor De Morgan, in which he gives the following elegant approximation to the value of  $\frac{1}{1+r} + \frac{1}{1+2r} + \frac{1}{1+3r} + \dots + \frac{1}{1+nr}$ .

He says the best approximation is

$$\frac{2.3205851}{r} \cdot \log. \frac{1+nr}{1+r} + \frac{1}{2} \left( \frac{1}{1+r} + \frac{1}{1+nr} \right) + \frac{r}{12} \left( \frac{1}{(1+r)^2} - \frac{1}{(1+nr)^2} \right) - \frac{r^3}{120} \left( \frac{1}{(1+r)^4} - \frac{1}{(1+nr)^4} \right);$$

error only in the sixth decimal when  $r=.1$ , or interest at 10 per cent.,

$$\frac{1}{1.1} + \frac{1}{1.2} + \frac{1}{1.3} + \dots + \frac{1}{2.0}.$$

Approximation	.	.	.	.	.	6.687715
Truth	.	.	.	.	.	6.687714

I am, Sir,

Your obedient Servant,

PETER HARDY.

*London Assurance, March 10, 1855.*

#### NOTICES OF NEW WORKS.

*On the Loans raised by Mr. Pitt during the first French war, 1793—1801, with some Statements in Defence of the Methods of Funding employed.* By WILLIAM NEWMARCH, one of the Honorary Secretaries of the Statistical Society. Effingham Wilson, Royal Exchange; Harrison, 59, Pall Mall; and Nissen and Parker, 43, Mark Lane.

WE had occasion some time back (*see* Vol. IV., page 78) to call the attention of our readers to an essay by this gentleman, "On the new supplies of gold," and to express an opinion of its value and importance to all en-
